## SUMMARY

---

Data engineer with a B.Sc. in Mathematics (UAM) and end-to-end ownership of business-critical banking data pipelines: regulatory reporting (FINREP, COREP, CIRBE) on Oracle/T-SQL, delivered on hard supervisory deadlines. Expert SQL and strong Python; production AWS experience (ECS Fargate, RDS, ALB) from shipping my own full-stack product, and distributed-systems depth from open-source work on multi-GPU training internals (FSDP, CUDA). Based in Madrid, full-time on-site.

## EXPERIENCE

---

### Data Scientist — Credit Risk (IRB Models)

Nov 2023 – Present

[Company] — Madrid

- Built and validated LGD (Loss Given Default) models for IRB credit-risk portfolios under regulatory compliance requirements — data-quality-critical work where pipeline errors carry supervisory consequences.
- Automated model-output delivery: Power Automate/Copilot Studio workflows turning LGD model outputs into structured, audit-ready reporting pipelines.

### SQL & PL/SQL Developer

Oct 2022 – Nov 2023

Álamo Consulting — Madrid

- Owned end-to-end regulatory reporting pipelines (FINREP, COREP, SIRBE/CIRBE) for a banking client on Oracle and T-SQL — business-critical deliveries to the regulator with zero tolerance for late or inaccurate data.
- Designed scalable transformations inside a large legacy regulatory codebase; accountable for accuracy and timeliness of every delivery cycle.

## EDUCATION

---

### B.Sc. in Mathematics

Sep 2018 – Jun 2023

Autonomous University of Madrid (UAM)

Final thesis: *Weak solutions to Navier–Stokes equations* (9/10). Founder of the university AI student association (70+ members).

### M.Sc. in Artificial Intelligence (8.67/10)

Sep 2024 – Oct 2025

International University of Valencia

Thesis: deep reinforcement learning for real-time prosthetic hand control (multimodal vision + sensor architecture).

## DISTRIBUTED SYSTEMS & OPEN SOURCE

---

### Liger-Kernel — github.com/linkedin/Liger-Kernel

PR #1128 (under review)

Production CUDA kernel library for LLM training, used at scale across industry

- Debugging a distributed-training bug in LigerTiledSwiGLUMLP: FSDP post-backward reshard hooks fired prematurely inside a tiling loop, corrupting parameter shards across GPUs — root-caused across the FSDP/kernel boundary.

### LEANN

Issue #41

- Proposed a hybrid BM25+RRF retrieval pipeline over a neural-only architecture to improve recall on sparse queries.

## SELECTED PROJECT

---

### regllm.xyz — full-stack data/AI product on AWS

Production, 2026

- Built and operate the entire platform solo: ingestion and RAG data pipeline over Spanish banking regulation, PostgreSQL/pgvector store, fine-tuned LLM serving, deployed on AWS (ECS Fargate, RDS, ALB); serving real users in early access.

TECHNICAL SKILLS

---

|              |                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------|
| Core         | SQL (expert: Oracle PL/SQL, T-SQL, PostgreSQL), Python (expert), C/C++ (strong)                                            |
| Data & Cloud | AWS (ECS Fargate, RDS, ALB), Docker, Linux, Git/GitHub, CI/CD; data modeling, batch pipeline design, data-quality controls |
| Distributed  | Multi-GPU training internals (FSDP/DDP), CUDA kernels, debugging complex concurrent systems                                |
| Databases    | Oracle, PostgreSQL (+pgvector), ChromaDB, SAS                                                                              |
| Fundamentals | Data structures & algorithms, OOP, distributed systems, code review                                                        |
